TREASURY CONTROLS ON PORTALDOT V3

Your treasury gets a say.

Spending limits, a waiting period and an independent guardian for cross-chain payout requests.

Multi-Chain & Cross-Chain Infra

Explore Airlock

THE PROBLEM

An authorized relay can request an unwanted payout.

Teams automate treasury payouts across networks. A mistake or compromised relay can turn a valid instruction into an unwanted release of funds.

Who needs Airlock

Treasury operators and teams that already accept payout instructions from other networks.

HOW IT WORKS

Requests start on Sepolia. Rules execute on Portaldot.

Ethereum Sepolia

Owner-controlled outbox emits a payout request.

→

Trusted RPC relay

Checks the event after six canonical confirmations.

→

Portaldot V3

Revive contract enforces rules and pays native tPOT.

Enforcement lives with the treasury

Limits, reserves, quarantine, pause and cancellation run on Portaldot. The relay attests the source event. Sepolia emits instructions; payout funds stay on Portaldot.

GUARDIAN WORKFLOW

A large request creates a review window.

01 **Queue the request**

A 4 tPOT request enters quarantine. Its funds remain reserved.

02 **Review the request**

The guardian checks the recipient and amount before release.

03 **Intervene when needed**

The guardian can pause releases and cancel the queued request.

Release also requires elapsed delay, available budget and an unpaused treasury.

INTERACTIVE DEMO

Try the guardian role, one step at a time.

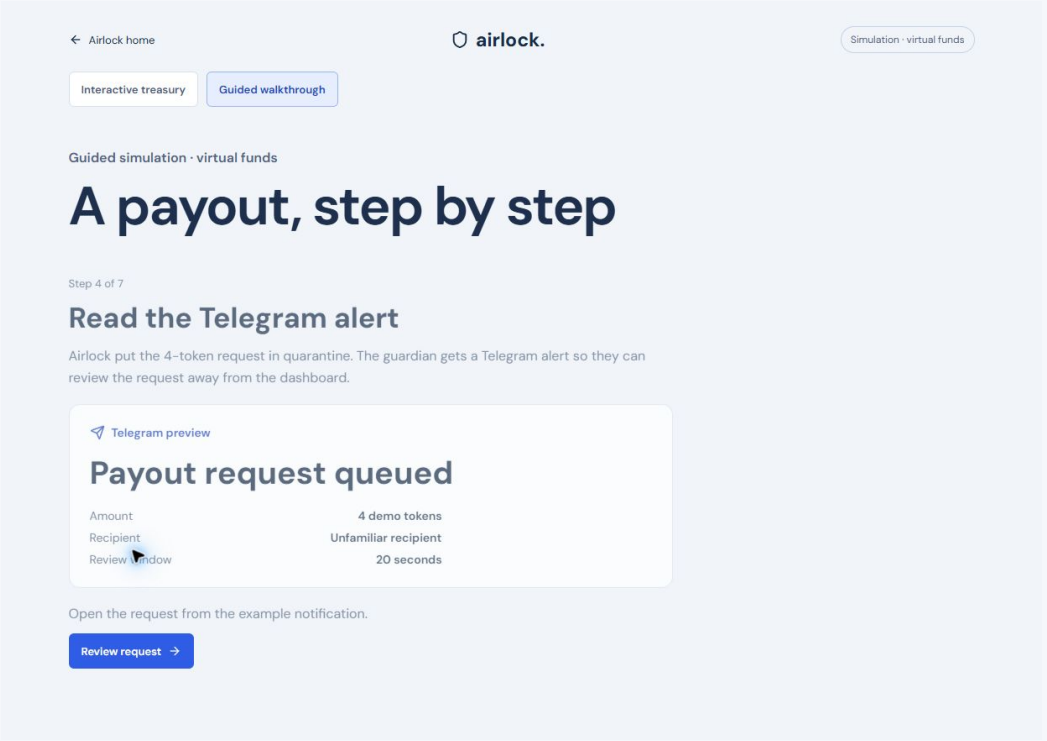

Create a virtual treasury.

Connect Telegram or skip it.

Submit a payout and decide how to respond.

Virtual funds. Optional real Telegram alerts.
The demo uses a 20-second review window.

RECORDED TESTNET EVIDENCE

Two public testnets. Verifiable payout receipts.

0.25 tPOT paid

A Sepolia request passed through the relay and produced a finalized payout on Portaldot V3.

1. Source request on Sepolia

0x5eb655a2...37f65a5

2. Portaldot payout receipt in the run record

0xd0e32600...5c22605

A separate controlled 4 tPOT request was queued and cancelled.

The guardian paused releases and cancelled the request. That recorded scenario paid 0 tPOT.

BUSINESS MODEL & NEXT STEPS

Start with teams already automating payouts.

Open-source contracts with a proposed managed service for monitoring, guardian workflows and onboarding.

$99 / month

Proposed service for one treasury

$500 onboarding

Proposed one-time setup

Next: validate three test-treasury pilots, measure operator effort and test willingness to pay. Then complete mainnet compatibility checks and deployment preparation.

Pricing is a pilot hypothesis. Customers keep their keys.
